Definition of Done

A *feature* or *sprint* is not done until the steps and procedures in this document have been followed. Done-ness is absolute. It's either done - and in the release - or not done - and goes back into the backlog.

Features

- Create feature branch from `develop`.
  Naming convention: `feature/name-of-feature`
- Implement feature.
- Run unit tests with `mvn test`
- Run on Android device
- Merge back into `develop` with
  `git merge --no-ff feature/name-of-feature`
- Delete the feature branch.
- Push to `develop`. Jenkins will automatically checkout and build the revision.

Done.

Sprint

- All features in the sprint are **done** as per the definition above.
- Branch into `release`. This effectively marks the end of the sprint.
- Test rigorously in production environment.
- Run `mvn install` and copy the release .apk to the apk folder.
- Merge release into `master` and `develop` with
  `git merge --no-ff feature/name-of-feature`
- Delete the `release` branch.
- Tag the `master` merge commit with sprint-n where n is the sprint number.
- Push the commits and tag.

Done.
